

# Namespace Aplib.Core

## Classes

### [Combinators](#)

Convenience class containing static methods for creating goal structures and tactics.

### [LiftingExtensionMethods](#)

Contains extension methods for lifting BDI cycle components into higher-order components.

### [Metadata](#)

Data structure to store information about a component which may be useful for debugging or logging.

## Interfaces

### [ICompletable](#)

Defines an object that can be completed.

### [IDocumented](#)

Represents an object that contains general information on an instance, such as [IMetadata](#).

### [IMetadata](#)

A collection of generic metadata for unique instances which should help visualise the instance with human-readable information.

## Enums

### [CompletionStatus](#)

Represents the state of a completable object.
